

# D Ice Cream Shop

TIME LIMIT: 2.0s  
MEMORY LIMIT: 2048MB

On a beach there are  $n$  huts in a perfect line, hut 1 being at the left and hut  $i + 1$  being 100 meters to the right of hut  $i$ , for all  $1 \leq i \leq n - 1$ . In hut  $i$  there are  $p_i$  people.

There are  $m$  ice cream sellers, also aligned in a perfect line with all the huts. The  $i$ -th ice cream seller has their shop  $x_i$  meters to the right of the first hut. All ice cream shops are at distinct locations, but they may be at the same location as a hut.

You want to open a new ice cream shop and you wonder what the best location for your shop is. You can place your ice cream shop anywhere on the beach (not necessarily at an integer distance from the first hut) as long as it is aligned with the huts and the other ice cream shops, even if there is already another ice cream shop or a hut at that location. You know that people would come to your shop only if it is strictly closer to their hut than any other ice cream shop.

If every person living in the huts wants to buy exactly one ice cream, what is the maximum number of ice creams that you can sell if you place the shop optimally?

## INPUT

The first line contains two integers  $n$  and  $m$  ( $2 \leq n \leq 200\,000$ ,  $1 \leq m \leq 200\,000$ ) — the number of huts and the number of ice cream sellers.

The second line contains  $n$  integers  $p_1, p_2, \dots, p_n$  ( $1 \leq p_i \leq 10^9$ ) — the number of people in each hut.

The third line contains  $m$  integers  $x_1, x_2, \dots, x_m$  ( $0 \leq x_i \leq 10^9$ ,  $x_i \neq x_j$  for  $i \neq j$ ) — the location of each ice cream shop.

## OUTPUT

Print the maximum number of ice creams that can be sold by choosing optimally the location of the new shop.

## SAMPLES

Sample input 1	Sample output 1
3 1 2 5 6 169	7

### Explanation of sample 1.

You can place the shop (coloured orange in the picture below) 150 meters to the right of the first hut (for example) so that it is the closest shop to the first two huts, which have 2 and 5 people, for a total of 7 sold ice creams.

Sample input 2	Sample output 2
4 2 1 2 7 8 35 157	15

**Explanation of sample 2.**

You can place the shop 170 meters to the right of the first hut (for example) so that it is the closest shop to the last two huts, which have 7 and 8 people, for a total of 15 sold ice creams.

Sample input 3	Sample output 3
